Irregular hypoechoic masses on breast ultrasound are usually considered suspicious lesions. If the lesions combine other features of malignancy such as spiculated margin, nonparallel orientation and posterior shadowing, they are considered moderate and highly suspicious for malignancy (BI-RADS categories 4b and 4c) or highly suggestive of malignancy (BI-RADS category 5).

Ultrasound (US), as one of the most used imaging modalities, has been recognized as a powerful and ubiquitous screening and diagnostic tool for physicians and radiologists. In particular, US imaging is widely used in prenatal screening in most of the world due to its relative safety, low cost, noninvasive nature, real-time display, operator comfort, and operator experience [1] .

Anesthesia of the foot can be accomplished by blocking the five peripheral nerves that innervate the area at the level of the ankle. This technique relies on anatomic landmarks that are easily identified. The ankle block can be used for all types of foot surgery and is safe and reliable, and has a high success rate.
