Thermodynamics of Surfaces and Interfaces: Concepts in ...

Understanding the structural and thermodynamic properties of surfaces, interfaces, and membranes is important for both fundamental and practical reasons. Important applications include coatings, dispersants, encapsulating agents, and biological materials. Soft materials, important in the development of new materials and the basis of many biological systems, cannot be designed using trial and error methods due to the multiplicity of components and parameters.

Thermodynamics of Interfaces Omid Moradi Shahre-Qods Branch, Islamic Azad University, Iran 1. Introduction Thermodynamics is the branch of science that is concerned with the principles of energy transformation in macroscopic systems. Macroscopic properties of matter arise from the behavior of a very large number of molecules.

Thermodynamics of Surfaces • Surface atoms are very different from atoms in the bulk. • The fewer neighbors of the surface cause it to have a very different and anisotropic chemical environment compared with the bulk. • The thermodynamics of the surface is most likely to be quite different from the thermodynamic properties of the bulk.

Introduction to surface quantities (Chapter 2 ...

Unanticipated nanostructures, characterized by the presence of phases at interfaces and surfaces which are unstable as bulk phases, can be thermodynamically stabilized due to the dominance of energy contributions of interfaces and surfaces in the total Gibbs energy of the system.

Thermodynamics of reactions and phase transformations at ...

An interface constitutes the separation surface between two phases. A phase constitutes a homogeneous part of a thermodynamic system, i.e., the part of the universe that is under investigation. The system has always to be defined by the investigator before she/he starts to perform some studies.

In a wider physicochemical perspective, Equation designates the “surface law of mass action” of the system that suggests that Le Châtelier's principle—if a chemical system at equilibrium experiences a change in temperature, pressure, and species concentration, then the equilibrium shifts to counteract the imposed change and a new equilibrium is established—must be complemented at interfaces by a term accounting for the surface work.
